The inventors claim DNA molecules comprising part or all of the human factor IX DNA. The invention also includes cDNA derived from human factor IX RNA. Specifically claimed are: recombinant DNA (the phage present in clone lambda HIX-1) deposited as NCIB NO. 11749; Recombinant DNA in which the cloning vehicle is the modified pAT 153 plasmid present in E.coli NCIB NO. 11747; Recombinant DNA in which the bovine factor IX DNA sequence is contained in the recombinant DNA that transformed into E.coli to form a clone deposited as NCIB NO.
                                                                                                                                                                                         Christmas disease; therapy; haemophilia; factor IX; blood clotting;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence encoded by part of the sequence of human factor IX cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Recombinant DNA cloning vehicles - useful in prodn. of factor IX polypeptide and of diagnostic probes for Christmas disease

Brownlee GG,

```
The inventors claim a vector which comprises a DNA SQ coding for factor IX (FIX) and elements providing expression of this SQ in host cells. The prepn. of DNA FIX is as follows. Polyadenylated mRNA is isolated from human liver, used to make 8s-DNA which is digested with S1 and the fragments over 1 kb cloned in pBR 322. Clones are selected by hybridisation with a 52-mer probe corresp. to the bovine factor IX SQ (ANDS)882).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The factor IX coding SQ (AANSO351) is first inserted into a non-sesential region of viral DNA, cloned in a bacterial plasmid. A double-reciprocal recombination procedure is then used to transfer the insert into the viral genome where it is propagated and
                                                                                                                                                                                      Cloning and expression vector for factor nine - for transforming
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Blood clotting; haemophilia B; vaccinia vector; cowpox vector.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ō
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The inventors claim a recombinant DNA having a human factor IX sequence pref. at least 50 nucleotides long, esp. 75-27000 nucleotides. A cloning vector contg. foreign DNA is also claimed. The foreign sequence pref. includes the whole of an exon sequence of the human factor IX genome. The cloning vehicle may be a modified pAT 153 plasmid. Also claimed is a labelled diagnostic probe sequence of 15 to 10000 nucleotides long Factor IX DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Prodn. of artificial human factor IX - by use of recombinant DNA sequences for host transformation and cultivation

Cultivation of infected cells produces very pure factor IX (a deficiency of which causes haemophilia B).

New nucleic acid constructs are described which comprise an hormone responsive element (HRE) and a transgene (T). Alternatively the nucleic acid construct, comprises at least one HRE and a transgene, where one of the HREs is not functionally linked to the transgene, where one of the HREs is not functionally linked to the transgene; The constructs preferably genes and for the delivery of vaccines. The constructs preferably comprise a transgene which encodes a protein which is lacking in a variety of genetic disorders or involved in conditions related in inappropriate responses to hormones, for example hormone-dependent cancers such as breast, ovarian, and endometrial cancers and prostate cancers the transgene may also be used to replace a defective gene resulting in such genetic disorders as haemophilia, von Willebrand disease, and cystic fibrosis. Vectors complising these constructs where the transgene is human clotting factor IX can be used for treating blood clotting disorders such as haemophilia A or B on cannietration to an organism or to a cellular system. The constructs transgene encodes a clotting factor such as clotting factor IX. The canning a hormone is spatime is that the hormone receptor complex contains a hormone receptor that becomes activated after binding of the specific hormone. The hormone receptor in the activated state is absent made and bind to its specific hormone responsive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              element. The presence of the hormone responsive element on the nucleic acid carrying a transgene encourages binding of a hormone receptor complex. Thus the activated hormone receptor acts as a link between the nucleic acid carrying the transgene and the hormone known to interact with the cell membrane.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; haemostatic; coagulant; blood clotting factor; factor VIII; factor IX; therapy; haemophilia A.
                                                                                                                                                                                                                                                                                                              Novel nucleic acid construct useful in gene therapy comprising an hormone responsive element and transgene in which the hormone responsive element is not functionally linked to the transgene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            100.0%; Score 46; DB 21; Length 4. 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a human factor IX protease. This protein is used in the construction of a novel non-glycosylated protein and truncated and zymagen forms of this protein, which have serine protease activity. The protein is composed of various domains from a factor IX family protein, namely a catalytic domain (CD) N-terminally bound to a zymagen-activating domain (ZAD), N-terminally bound to an EGF1 and/or EGF2 domain (EGF = epidermal growth factor-like domain). Such proteins (potentially useful as regulators of factor IX family proteins (potentially useful as regulators of coagulation, fibrinolysis and homestasis). The protein in zymagen form is also useful in assays for detecting factor IX activity in aqueous solution (specifically in body fluids). The protein can be used to produce co-crystals with protease variants or inhibitors for X-ray structural analysis and drug modelling and as restriction proteases in biotechnology. These truncated proteins have the same specificity as factor IX family proteases and can be produced in a form that allows production of active enzyme by conversion to native form and enzymatic cleavage.

The invention relates to nucleic acid sequences which regulate gene
     New regulatory elements that control age-related gene expression, useful in gene therapy and for reducing Factor IX expression
                                         Disclosure; Fig 8A-E; 225pp; English.

                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                 The present invention relates to an improved method for the production of recombinant human blood clotting factors, especially factors VIII and IX, using an immortalised cell line stably expressing viral transcription activators and carrying a vector comprising a promoter and a sequence encoding the blood coagulation factor. The factor VIII mutein or a gene transfer vector is used in the preparation of agents for treating haemophilia, especially haemophilia A. The present sequence is human wild-type factor IX protein encoded by vector pTGF36hyg.

The invention in an age-related manner and for in a liver-specific manner.

C The invention identifies regions of the human factor IX (hPIX) gene, and a region of the human protein C (hPC) gene, which are age-related are guidatory sequences. The hPIX age-related regulatory sequences are designated ABS' (AAFS4018) and AB3' (AAFS4013) and AB3' acting to stabilise hFIX mRNA in an age-related manner, on independently exert effects on hFIX mRNA in an age-related manner, they can independently exert effects on hFIX mRNA in an age-related manner, on the ABS' acting to stabilise hFIX mRNA and AB3' acting to increase hFIX mRNA and contains two PRA3' (polyama virus extivator) allements of the gene age-related regulatory sequence is found in the S' UTR (ARF84081), and Contains two PRA3' (polyama virus extivator 3) elements of 5'-GAGGAAA-3' and S'-CAGGAAA-3'. The age-related regulatory sequence in the romatrion, along with their homologues, variants and fragments of the invention, along with their homologues, variants and fragments of the syression vectors include those encoding proteins involved in blood expression of a dealard equence in an age-related fashion in a host call incagnate protein c and antithrombin in such age-regulatable expression vectors include those encoding proteins involved in blood continues protein c and antithrombin in such age-related and one continues the procession of target genes for expression in such age-related and one continues and antithrombin in such age-related and one continues the promoter. The expression vectors of the T3 promoter and the SP6 promoter. The expression vectors of the T3 promoter and the SP6 promoter. The expression vectors of the T3 promoter and the SP6 promoter. The expression vectors of the C5 specifically, they may be used to express age-related shall and one contain vectors of the invention and sectors of the

"Identification of IgB-binding proteins as 28 albumin and conglutin in
almond (Prunua dulcis) seed.";
Submitted (PEB-2001) to the SWISS-PROT data bank.
-!- FUNCTION: MAY FUNCTION AS SEED STORAGE PROTEINS. HAS AN IGE-
BINDING ACTIVITY.
-!- SUBCELGULAR LOCATION:
-!- TISSUE SPECIFICITY: SEED.
-!- DEVELOPMENTAL STAGE: EXPRESSED DURING SEED MATURATION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          01-JUN-2001 (TrEMBLrel. 17, Last sequence update)

Genet. 223:138-147(1990).
FUNCTION: Carrier of the growing fatty acid chain in fatty acid biosynthesis. Is involved in the transfer of long hydroxylated fatty acids to lipid A. Is acylated predominantly with 27-hydroxyoctacosanoic acid.
                                                                                                                                                                                                                            SEQUENCE FROM N.A., SEQUENCE OF 1-27; 29-40 AND 68-74,
CHARACTREIZATION, AND MASS SPECTROMETRY.

Science 287:1809-1815(2000).

--- FUNCTION: Ransep catalyzes the removal of the S'-leader sequence from pre-tRNA to produce the mature S'terminus. It can also cleave other RNA substrates such as 4.55 RNA. The protein component plays an auxiliary but essential role in vivo by binding to the S'-leader sequence and broadening the substrate specificity of the ribozyme (By similarity).

C. -- CARALYITY: Endoucteolytic cleavage of RNA, removing S'-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright. -!- CATALYTIC ACTIVITY: Release of an N-terminal amino acid, Xaa-|-Xbb-, in which Xaa is preferably Leu, but may be other amino acids including Pro although not Arg or Lys, and Xbb may be Pro. COFACTOR: MANGARESE (9% SIMILARITY)
-!- COFACTOR: MANGARESE (9% SIMILARITY)
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SIMILARITY: BELONGS TO PEPTIDASE PAMILY M17.

The maize actin-depolymerizing factor, ZmADF3, redistributes to the Jiang C.J., Weeds A.G., Hussey P.J.;
Tanalocate into the nucleus with actin.";
Plant J. 12:1035-1043(1997).
L. FINCTION: ACTIN-DEPOLYMERIZING PROTEIN. SEVERS ACTIN FILAMENTS
C. -- FUNCTION: ACTIN-DEPOLYMERIZING PROTEINS In this position as at the tip of the emerging hair and remains in this position as elongation proceeds
C. -- TISSUE SPECIFICITY: Expressed in all tissues except pollen.
C. -- SIMILARITY: BELONGS TO THE ACTIN-BINDING PROTEINS ADF FAMILY.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 37634, Application US/09864761

Patent No. US20020048763A1

GENERAL INFORMATION:

APPLICANT: Rank, David R.

APPLICANT: Rank, David R.

APPLICANT: APPLICANT: Chen, Wensheng

TITLE OF INVENTION: HUMAN GENOME-DERIVED SINGLE EXON NUCLEIC ACID PROBES USEFUL FOR

TITLE OF INVENTION: GENE EXPRESSION ANALYSIS BY MICROARRAY

FILE REFERENCE: Aeomica-X-1

CURRENT APPLICATION NUMBER: US/09/864,761

CURRENT PILING DATE: 2001-05-23

PRIOR PILING DATE: 2000-02-04

PRIOR FILING DATE: 2000-05-26

PRIOR PILING DATE: 2000-05-26

PRIOR PILING DATE: 2000-05-26

PRIOR PILING DATE: 2000-05-26

                                                                                                                                                                                                                                                                 Sequence 18, Application US/08222851

Patent No. 5723128

GENERAL INFORMATION:
APPLICANT: CLASSERGER, CAROL A.
APPLICANT: PARHAM, PETER
TITLE OF INVENTION: CYTOTOXIC T-CELL LYMPHOCYTE ("CTL")
TITLE OF INVENTION: ACTIVITY REGULATION BY CLASS I MHC PEPTIDES
NUMBER OF SEQUENCES: 43
CORRESPONDENCE ADDRESS:

Patent No. 5539092
GENERAL INFORMATION:
APPLICANT: Robert Haselkorn and Piotr Gornicki
TITLE OF INVENTION: Cyanobacterial and Plant Acetyl-CoA
TITLE OF INVENTION: Carboxylase
NUMBER OF SEQUENCES: 116
CORRESPONDENCE ADDRESS:
ADDRESSEE: Arnold, White & Durkee
OPERATING SYSTEM: MS-DOS, Windows for Workgroups 3.11 SOFTWARE: Microsoft Word for Windows 6 CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/797,842
                                                          APPLICATION NUMBER: US/08/797,842
FILING DATE: 10-Feb-1997
CLASSIFICATION: 530
PRIOR APPLICATION DATA:
APPLICATION NUMBER: 08/381,891
FILING DATE: Feburary 8, 1995
ATTORNEY/AGENT INFORMATION:
NAME: Michaelson, Peter L.
REGISTRATION NUMBER: 30090
REGISTRATION NUMBER: 30090
REGISTRATION NUMBER: Stitching-S
TELEPHONE: (908)530-6671
TELEPHONE: (908)530-6671
